Hardware Migration

Conclusion

TCG's Proposal for Trusted Computing

Trusted Computing Group: Industry consortium to develop specifications to

[...] protect and strengthen the computing platform against software-based attacks.

Key Idea: Base Trusted Computing Base on small piece of secure hardware.

Recent developments: TNC

Our Motivation: TCG hardware widely deployed
→ Combine with secure operating systems to increase security

Here: Address problems and propose solutions.

Trusted Platform Module

Main components:

- ▶ Cryptographic engine
- ▶ Non-volatile tamper resistant storage
 - ▶ Storage Root Key **SRK** → virtual shielded storage
- ▶ Endorsement Key
- ▶ Platform Configuration Registers **PCR**
 - ▶ write access only via **Extend** operation

Needs support by Trusted Software inside TCB.

Main TCG Mechanisms

- ▶ **Integrity measurement**

- ▶ Establish platform configuration at boot time

- ▶ **Attestation**

- ▶ Attest platform configuration to remote party
- ▶ (Subset of) PCRs signed with Attestation Identity Key

- ▶ **Sealing**

- ▶ Exclusive availability of information for certain configurations
- ▶ TPM-enforced

- ▶ **Maintenance** for hardware migration

Integrity & Boot Process

Establish Chain of Trust for TCB:

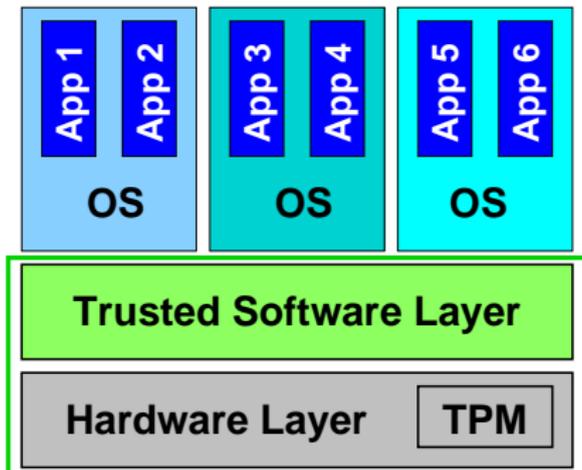

- ▶ Start from the Core Root of Trust
- ▶ **Measure**: $c \leftarrow \text{SHA1}(\text{next software chunk})$
- ▶ **Extend PCR**: $\text{PCR}_i \leftarrow \text{SHA1}(\text{PCR}_i, c)$
- ▶ **Execute** software chunk
 - ▶ might enter another measure-extend-execute cycle

Results:

- ▶ PCRs **specific** for current **platform configuration**
- ▶ **Link** between PCRs and software / security properties?
- ▶ Changed software **not blocked** but **detected**

Architecture of Trustworthy Platforms

Use TCB comprised of hardware and software:

- ▶ TPM
- ▶ Trusted software
- ▶ OS runs on top

Sealing

Places data in encrypted blob:

- ▶ Availability of data depends on predefined PCR values
- ▶ TPM delivers data only if those PCRs are present
- ▶ otherwise data remains encrypted

Usage Scenarios:

- ▶ Cryptographic keys for accessing networks
- ▶ Documents, Media files, etc.

Key question:

What happens to sealed data when patching the TCB?

Roadmap

Introduction

Problems with Sealed Data

Platform Updates

Hardware Migration

Platform Updates

Hardware Migration

Conclusion

Sealed Data & Platform Updates

Consequences of integrity measurement:

- ▶ Changing software in TCB changes hashes
- ▶ Results in changed PCR values
- ▶ Unseal does not release sealed data

- ▶ Intended for malicious / non-trustworthy “TCB”
- ▶ What about patches?
 - ▶ Typically preserve security properties
 - ▶ Should close security holes

Cannot distinguish good and bad changes!

Sealed Data & Hardware Migration

Maintenance procedure:

- ▶ Process is **optional**
- ▶ To our knowledge **not implemented** in existing TPMs
- ▶ Works only for TPMs of **same vendor**
- ▶ Needs interaction with vendor
 - ▶ Vendor out of business?
 - ▶ Price?

Availability of sealed data when HW breaks?

Roadmap

Introduction

Problems with Sealed Data

Platform Updates

- Software-Supported Updates

- TPM-Supported Updates

- Property-Based Sealing

Hardware Migration

Conclusion

Platform Updates

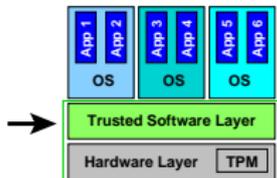

Requirements for a patched TCB:

- ▶ **Security:** Remote party wants that new platform configuration still adheres to security policy.
- ▶ **Availability:** Owner / User wants information available after patch.

Our solutions:

- ▶ Software-supported
- ▶ TPM-supported
- ▶ Property-based sealing

Software-Supported Updates

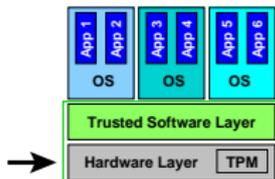

TCB component “Update Manager”:

- ▶ Keep record of sealed data blobs
- ▶ Know new PCR values
- ▶ Ensure adherence to security policy
 - ▶ Signature by Trusted Third Party → Key management
- ▶ Be fail-safe

Pros & Cons:

- ▶ Works with **current TCG hardware**
- ▶ Handles only data sealed for **current configuration**
- ▶ Requirements for **TCB design**
- ▶ Difficult for **parallel OS instances**, e.g. bootloader updates

TPM-Supported Updates

Key ideas:

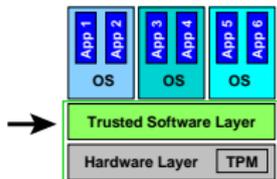

- ▶ New TPM command `TPM_UpdateSeal`:
 - ▶ Data sealed for S_i is resealed for S_j
- ▶ Delegate decision on equivalence of PCR values S_i and S_j
- ▶ Trusted Third Party issues update certificate

$$cert_{update} = \text{Sign}(S_i, S_j)$$

Pros & Cons:

- ▶ New TPM command, but should be easy to implement
- ▶ Avoids problems of software-only solution

Property-Based Sealing

Key Ideas:

- ▶ Seal data for **abstract properties**
 - ▶ e.g. “Strong Process Isolation”
- ▶ Mapping between properties and binary measurements

Pros & Cons:

- ▶ Better **model for security functionality**
- ▶ Resolves problems with handling sealed data
- ▶ Hides concrete binary measurements → **privacy**
- ▶ **To do:** describe useful properties

Implementing Property-Based Sealing

Use TPM-support for property-based sealing:

- ▶ Describe properties by **abstract configuration**
- ▶ Data is sealed for abstract configurations only
- ▶ TPM_UpdateSeal **translates** to binary measurements
- ▶ Update certificate states that configuration **implements** security properties

Pros & Cons:

- ▶ **Elegant solution** for update problem
- ▶ **Avoids discrimination** of operating systems

Roadmap

Introduction

Problems with Sealed Data

Platform Updates

Hardware Migration

Requirements

Migration Protocol

Conclusion

Migrating to another Hardware Platform

Requirements for TPM migration:

- ▶ **Completeness:** Move secret state of source TPM to destination TPM; clear source afterwards.
- ▶ **Security:** Migration only if destination TPM at least as secure as source TPM.
→ **Delegate decision** to trusted third party.
- ▶ **Fairness:** openly specified process
 - ▶ No need for interaction with vendor

Design of Migration Protocol

Key ideas:

- ▶ **Secure export** of non-volatile memory etc. under SRK
- ▶ **Delegate decision** on equivalent security of TPMs
 - ▶ Trusted TPM Migration Authority TMA
 - ▶ **Migration certificate** on TPM identities (endorsement keys) EK_s and EK_d

$$cert_{mig} = \text{Sign}(\text{Hash}(EK_s), \text{Hash}(EK_d))$$

- ▶ Special **export mode** for source TPM that allows only:
 - ▶ Extract SRK_s encrypted under EK_d
 - ▶ Clear TPM

Summary and Conclusion

- ▶ Update & migration problems with sealed data
- ▶ Proposed solutions for update issue
 - ▶ Software-only
 - ▶ TPM-supported
 - ▶ Property-based sealing
 - ▶ Combining TPM-supported with property-based solution
- ▶ Proposed secure & fair migration protocol
 - ▶ Improves over currently optional maintenance feature
- ▶ **Ongoing work:** TC-project at RU Bochum implements property-based sealing and attestation, see
