## Iterated Block Cipher

Block cipher:

$$
E_{K}(P):\{0,1\}^{k} \times\{0,1\}^{n} \rightarrow\{0,1\}^{n}
$$

Iterated block cipher:

$$
\begin{gathered}
P \rightarrow \Re_{k_{1}} \rightarrow \Re_{k_{2}} \rightarrow \Re_{k_{3}} \rightarrow \Re_{k_{4}} \rightarrow \cdots \rightarrow \Re_{k_{n-1}} \rightarrow \Re_{k_{n}} \rightarrow C \\
C=\Re_{k_{n}} \circ \cdots \circ \Re_{k_{2}} \circ \Re_{k_{1}}(P)
\end{gathered}
$$

## Iterated Block Cipher with Periodic Subkeys

$$
P \rightarrow \mathfrak{R}_{k_{1}} \rightarrow \cdots \rightarrow \mathfrak{R}_{k_{m}} \rightarrow \mathfrak{R}_{k_{1}} \rightarrow \cdots \rightarrow \mathfrak{R}_{k_{m}} \rightarrow \cdots \rightarrow \mathfrak{R}_{k_{1}} \rightarrow \cdots \rightarrow \rightarrow \mathfrak{R}_{k_{m}} \rightarrow C
$$

## Iterated Block Cipher with Periodic Subkeys

- The cipher can be presented as a cascade of identical functions $F_{k}$.

## Slide Cryptanalysis [Biryukov Wagner 99]

## Slide Cryptanalysis [Biryukov Wagner 99]

$$
\begin{aligned}
P \longrightarrow & F_{k} \xrightarrow{ } \rightarrow F_{k} \rightarrow \cdots \rightarrow F_{k} \rightarrow F_{k} \rightarrow C \\
& P^{\prime} \xrightarrow{\rightarrow} \rightarrow F_{k} \rightarrow F_{k} \rightarrow \cdots \rightarrow F_{k} \rightarrow F_{k} \rightarrow C^{\prime} \\
& P^{\prime}=F_{k}(P)
\end{aligned}
$$

## Slide Cryptanalysis [Biryukov Wagner 99]

## Slide Cryptanalysis [Biryukov Wagner 99]

$$
\begin{gathered}
P \longrightarrow F_{k} \xrightarrow{P} \longrightarrow F_{k} \longrightarrow \cdots \longrightarrow F_{k} \longrightarrow F_{k} \rightarrow C \\
\\
P^{\prime} \rightarrow F_{k} \longrightarrow F_{k} \longrightarrow \cdots \rightarrow F_{k} \rightarrow F_{k} \longrightarrow C^{\prime} \\
P^{\prime}=F_{k}(P) \quad C^{\prime}=F_{k}(C) \quad \text { (Slid pair) } \\
\operatorname{Pr}\left[P^{\prime}=F_{k}(P)\right]=2^{-n} \quad \operatorname{Pr}\left[C=F_{k}^{-1}\left(C^{\prime}\right), P^{\prime}=F_{k}(P)\right]=2^{-n}>2^{-2 n} \\
\Longrightarrow 2^{n} \text { pairs }\left((P, C),\left(P^{\prime}, C^{\prime}\right)\right) \text { are expected to find a slid pair. }
\end{gathered}
$$

## Slide Cryptanalysis [Biryukov Wagner 99]

Typical countermeasures: Key-schedule or round constants.

## Slide Cryptanalysis [Biryukov Wagner 99]

$$
\begin{aligned}
& P \longrightarrow F_{k} \xrightarrow{P} \longrightarrow F_{k} \longrightarrow \cdots \longrightarrow F_{k} \longrightarrow F_{k} \rightarrow C \\
& \\
& P^{\prime} \xrightarrow{ } \rightarrow F_{k} \longrightarrow F_{k} \longrightarrow \cdots \rightarrow F_{k} \rightarrow F_{k} \longrightarrow C^{\prime} \\
& P^{\prime}=F_{k}(P) \quad C^{\prime}=F_{k}(C) \quad \text { (Slid pair) } \\
& \operatorname{Pr}\left[P^{\prime}=F_{k}(P)\right]=2^{-n} \quad \operatorname{Pr}\left[C=F_{k}^{-1}\left(C^{\prime}\right), P^{\prime}=F_{k}(P)\right]=2^{-n}>2^{-2 n} \\
& \Longrightarrow 2^{n} \text { pairs }\left((P, C),\left(P^{\prime}, C^{\prime}\right)\right) \text { are expected to find a slid pair. }
\end{aligned}
$$

Typical countermeasures: Key-schedule or round constants.
This Work:
Probabilistic technique to overcome round constants in block ciphers based on the Even-Mansour scheme with a single key.

## Even-Mansour Scheme with a Single Key

## Even-Mansour Scheme with a Single Key

- Block ciphers like LED-64, PRINCE ${ }_{\text {core }}$, Zorro and PRINTcipher.

## LED-64

- Presented at CHES 2011 [Guo et al 11]
- 64-bit block cipher and supports 64-bit key
- 6 steps
- Each step consists of four rounds.

## Zorro

- Presented at CHES 2013 [Gérard et al 13]
- 128-bit block cipher and supports 128-bit key
- 6 steps
- Each step consists of four rounds

Probabilistic Slide Cryptanalysis

## Applications on LED-64 and Zorro

Conclusion

School of Science

## Overview of Previous Attacks

- Slide cryptanalysis requires known plaintexts.

## Overview of Previous Attacks

- Slide cryptanalysis requires known plaintexts.
- But it is limited to the ciphers with identical rounds.

## Overview of Previous Attacks

- Slide cryptanalysis requires known plaintexts.
- But it is limited to the ciphers with identical rounds.
- Differential cryptanalysis is usually applicable on any round functions [Biham Shamir 90].

## Overview of Previous Attacks

- Slide cryptanalysis requires known plaintexts.
- But it is limited to the ciphers with identical rounds.
- Differential cryptanalysis is usually applicable on any round functions [Biham Shamir 90].
- But there exists a lower bound for active S-boxes and it usually requires chosen plaintexts.

## Overview of Previous Attacks

- Slide cryptanalysis requires known plaintexts.
- But it is limited to the ciphers with identical rounds.
- Differential cryptanalysis is usually applicable on any round functions [Biham Shamir 90].
- But there exists a lower bound for active S-boxes and it usually requires chosen plaintexts.
- Related-key differential usually has less active S-boxes and applicable on more rounds [Kelsey et al 97].

## Overview of Previous Attacks

This Work
Exploit previous ideas to take advantage of the positive properties and overcome the negative aspects!

## Probabilistic Slide Distinguisher

- Assume there exists a sequence of differences
$\mathcal{D}=\left\{\Delta_{0}, \ldots, \Delta_{s-1}\right\}$ such that
$\operatorname{Pr}\left[F_{r}(x) \oplus F_{r-1}\left(x \oplus \Delta_{r-2}\right)=\Delta_{r-1}\right]=2^{-p_{r-1}}$ where $0 \leq p_{r}$.
- A differential-type characteristic with input difference $\Delta_{\text {in }}=\Delta_{0}$ and output difference $\Delta_{\text {out }}=\Delta_{s-1}$ can be obtained with probability $2^{-p}=\Pi_{r=1}^{s-1} 2^{-p_{r}}$.

## Probabilistic Slide Distinguisher

## Probabilistic Slide Distinguisher

## Probabilistic Slide Distinguisher

$P^{\prime} F^{\prime}(P \oplus K)=$ probability $^{2-p}$

$$
C \oplus F_{s}^{-1}\left(C^{\prime} \oplus K\right)=\Delta_{\text {out }}
$$

$\operatorname{Pr}\left[P^{\prime} \oplus F_{1}(P \oplus K)=\Delta_{\text {in }}\right]=2^{-n}$
$\operatorname{Pr}\left[C \oplus F_{s}^{-1}\left(C^{\prime} \oplus K\right)=\Delta_{\text {out }}, P^{\prime} \oplus F_{1}(P \oplus K)=\Delta_{\text {in }}\right]=2^{-n-p}$
$\Longrightarrow 2^{(n+p)}$ pairs $\left((P, C),\left(P^{\prime}, C^{\prime}\right)\right)$ are expected to find a right slid pair

## Key Recovery

- The right slid pair satisfies the relation

$$
C^{\prime} \oplus F_{s}\left(C \oplus \Delta_{\text {out }}\right)=K=P \oplus F_{1}^{-1}\left(\Delta_{\text {in }} \oplus P^{\prime},\right)
$$

## Key Recovery

- The right slid pair satisfies the relation

$$
C^{\prime} \oplus F_{1}^{-1}\left(\Delta_{\text {in }} \oplus P^{\prime}\right)=P \oplus F_{s}\left(C \oplus \Delta_{\mathrm{out}}\right)
$$

## Key Recovery

- The right slid pair satisfies the relation

$$
C^{\prime} \oplus F_{1}^{-1}\left(\Delta_{\text {in }} \oplus P^{\prime}\right)=P \oplus F_{s}\left(C \oplus \Delta_{\mathrm{out}}\right)
$$

For given $2^{(n+p) / 2}$ known $(P, C)$ :
Step 1 For all pairs $(P, C)$ compute $C \oplus F_{1}^{-1}\left(P \oplus \Delta_{\text {in }}\right)$ and store the computed value with $C$ in the hash table $T_{1}$.

## Key Recovery

- The right slid pair satisfies the relation

$$
C^{\prime} \oplus F_{1}^{-1}\left(\Delta_{\text {in }} \oplus P^{\prime}\right)=P \oplus F_{s}\left(C \oplus \Delta_{\mathrm{out}}\right)
$$

For given $2^{(n+p) / 2}$ known $(P, C)$ :
Step 1 For all pairs $(P, C)$ compute $C \oplus F_{1}^{-1}\left(P \oplus \Delta_{\text {in }}\right)$ and store the computed value with $C$ in the hash table $T_{1}$.
Step 2 For all pairs $(P, C)$ compute $P \oplus F_{s}\left(\Delta_{\text {out }} \oplus C\right)$ and store the computed value with $C$ in the hash table $T_{2}$.

## Key Recovery

- The right slid pair satisfies the relation

$$
C^{\prime} \oplus F_{1}^{-1}\left(\Delta_{\mathrm{in}} \oplus P^{\prime}\right)=P \oplus F_{s}\left(C \oplus \Delta_{\mathrm{out}}\right)
$$

For given $2^{(n+p) / 2}$ known $(P, C)$ :
Step 1 For all pairs $(P, C)$ compute $C \oplus F_{1}^{-1}\left(P \oplus \Delta_{\text {in }}\right)$ and store the computed value with $C$ in the hash table $T_{1}$.
Step 2 For all pairs $(P, C)$ compute $P \oplus F_{s}\left(\Delta_{\text {out }} \oplus C\right)$ and store the computed value with $C$ in the hash table $T_{2}$.
Step 3 For each collision in $T_{1}$ and $T_{2}$ find corresponding ciphertexts $C$ and $C^{\prime}$ then compute a key candidate $K=C^{\prime} \oplus F_{S}\left(C \oplus \Delta_{\text {out }}\right)$.

## More Output Differences

$$
P^{\prime}=F_{1}\left(P \oplus \Delta_{\text {in }}\right) \quad C^{\prime}=F_{s}\left(C \oplus \Delta_{\text {out }}^{i}\right), 1 \leq i \leq L
$$

$\operatorname{Pr}\left[P^{\prime}=F_{1}\left(P \oplus \Delta_{\text {in }}\right)\right]=2^{-n}$
$\operatorname{Pr}\left[P^{\prime}=F_{1}\left(P \oplus \Delta_{\text {in }}\right), C^{\prime}=F_{s}\left(C \oplus \Delta_{\text {out }}^{i}\right)\right]=2^{-n} \sum_{i=1}^{L} 2^{-p_{i}}$

- Decrease the data requirement by increasing the total probability.
- This comes with the cost of repeating the attack algorithm $L$ times.

$\dagger$ - this attack is applicable just on $2^{64}$ keys (out of $2^{128}$ ), CP - Chosen Plaintexts, KP - Known Plaintext.

## Introduction

Slide Cryptanalysis
Even-Mansour Scheme with a Single Key

Probabilistic Slide Cryptanalysis

Applications on LED-64 and Zorro

Conclusion

School of Science

## Conclusion and Future Work

## Conclusion

- Framework of probabilistic slide cryptanalysis on EMS which requires known-plaintext in the single-key model.
- The relation between round constants should be taken into account.
- Applications of the probabilistic slide cryptanalysis on LED-64 and Zorro.

## Future Work

- Application on other EMS block ciphers.
- Improve the results on Zorro and LED-64 by exploiting differential instead of differential characteristic.

## Thanks for your attention!
